

KAIROSCOPE

Problem statement :When it comes to celebration photographs becomes one of the important thing as it reminds us of the old memories.The memories we had share with our dear ones and now days it becomes hard find photography shop in each area as everyone has camera has a second option option in their phones so we come up with a website where customer can book a photographer just by completing few steps from their home.

- In current system, customers have to call or meet photographers and book them.
- Photographers are booked only by their contact or limited peoples who are known to them.
- Customer compares only knowing photographers and book one of them.
- Current system is manual. Photographers keep track of their orders in Register.
- Whenever new order comes, photographers check availability manually and register new orders accordingly.
- Photographers maintain their photography albums and show to the customers. They maintain their information about various functions and their cost manually
- Customers have to meet or call photographers to book them.
- Checking availability in existing data for accepting new orders is tedious.
- Maintenance of all manual records is difficult.
- Photographers don't get orders from other than contact o nearby persons.
- Customers don't get many options to compare their cost and quality.
- The new system will provide a unified platform for Photographers.
- User friendly.
- The new system will save customer's time and money.
- In this system finding best Photographers according to their quality and cost is easy.
- Customers view many photographers on one website and book them.
- Photographers get more orders from unknown people also.
- Photographers get the opportunity to show their talent to more people.
- Photographers maintain their record on that website only.
- Customers get more options of Photographers to compare and book them.
- Customers don't have to go Photographers studio , they directly book online.

Abstract:

This website will shortlist the available number of photographers according to requirements of the customer. This website is designed to provide better options of photographers as it is difficult to find a suitable photographer according to the event and affordable budget. Customer can book a photographer for various events like wedding, baby shower, pre-wedding, cultural events, college fest etc. According to the requirements customer can select the suitable photographer and book the photographer if available. The request is sent to the admin. Admin accepts the deal and then a confirmation message is sent to both customer and photographer.

Software requirement:

- Operating system : Windows 10 and later.
- Server: Apache
- Application used : Atom
 - Node JS
 - Mysql Database

Hardware requirement:

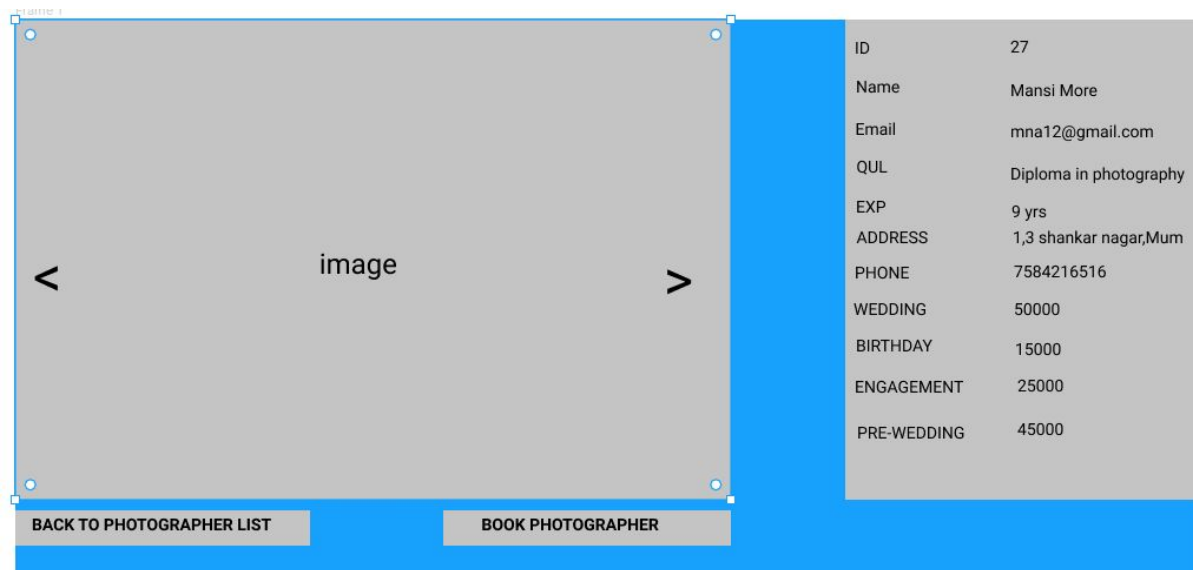

- Minimum 512mb RAM
- Intel 2GHZ processor
- Minimum 1GB secondary storage
